► General Relativity:

Einstein's field equations:

$$G_{\mu\nu} = \frac{8\pi G}{c^4} T_{\mu\nu} + \Lambda g_{\mu\nu} \quad (1)$$

► Hubble's law:

$$v = H_0 r \quad (2)$$

► Expanding universe:

$$r(t) = a(t)\chi \quad (3)$$

► **Cosmological principle:**

The universe is homogeneous and isotropic [1].

► **Fluid equation:**

$$\dot{\rho} + 3H(1 + \omega)\rho = 0, \text{ with } H = \frac{\dot{a}}{a} \quad (4)$$

► **Friedmann equation:**

$$\dot{a}^2 = \frac{8\pi G}{3c^2}\rho a^2 - \kappa \frac{c^2}{\chi^2} \quad (5)$$

► **Raychaudhuri equation:**

$$\frac{\ddot{a}}{a} = -\frac{4\pi}{3}G(\rho + 3p) \quad (6)$$

Good place to talk about when acc'n and dec'n occur.

$$\begin{aligned} \rho + 3p &> 0 \\ \rho + 3p &< 0 \end{aligned}$$

Concordance model (Λ CDM-model)

► Dark Matter

► Accelerated expansion:

Observations of the luminosities of type Ia supernovae suggest that the universe is undergoing an accelerated expansion [2, 3], which suggests the existence of a Dark energy element.

► Assume a perfect fluid equation of state:

$$P = \omega \rho \quad (7)$$

► 3 Different epochs:

- Radiation ($\omega = \frac{1}{3}$): $\rho = C_{rad} a^{-4}$
- Matter ($\omega = 0$): $\rho = C_{dust} a^{-3}$
- Dark Energy ($\omega = -1$): $\rho = C_{DE}$

The universe passed through many phases. These 3 are the most prominent, and longest epochs

► Different Chaplygin gas equations of state [4]:

- Original Chaplygin gas (OCG):

$$P = -\frac{A_1}{\rho} \quad (8)$$

- Generalised Chaplygin gas (GCG):

$$P = -\frac{A_1}{\rho^\alpha}, \quad \alpha > -1 \quad (9)$$

- Modified Chaplygin gas (MCG):

$$P = A_2 \rho - \frac{A_1}{\rho^\alpha}, \quad \alpha > -1 \quad (10)$$

Chaplygin gas

Solution to the fluid equation

► Solving the Fluid equation for a MCG equation of state:

$$\rho = \left[\frac{C_2 (1+z)^{3(\alpha+1)(1+A_2)} + A_1}{1+A_2} \right]^{\frac{1}{1+\alpha}} \quad (11)$$

Figure: Here we have taken $A_1 = 50$, $A_2 = C_2 = 1$ and $\alpha = 1$. The figure shows energy density ρ vs red-shift z .

Conclusions

- ▶ Both Chaplygin gas and the PPUDF equations of state result in behaviour for the energy densities, dimensionless Hubble parameter and acceleration that corresponds with the Concordance model for dust dominated epochs and Dark energy dominated epochs.
- ▶ It is possible to unify both dark elements into a single dark fluid by parametrizing the equation of state.
- ▶ *any limitations to these models?*
- ▶ Future work on this would include constraining the free parameters with observation.
